Kinematics of Particles - Rectilinear Motion

As barrel recoils with initial velocity v_0 , piston moves and oil is forced through orifices in piston, causing piston and cylinder to decelerate at rate proportional to their velocity. Determine $v(t)$, $x(t)$, and $v(x)$. $a = -kv$. SOLUTION: • Integrate $a = dv/dt = -kv$ to find $v(t)$.

Solving Rectilinear Problems - Example Problem 2.3-2 . A car is driving down a straight flat road. The acceleration of the car follows the a-t graph shown. The car starts from rest at $t = 0 = 0$ seconds, reaches its maximum velocity of 45 m/s, and drives at that velocity for 5 seconds. The driver then applies the brakes slowing the car to an eventual stop.

Dynamics is general, since the momenta, forces and energy of the particles are taken into account. In this instance, sometimes the term dynamics refers to the differential equations that the system satisfies (e.g., Newton's second law or Euler–Lagrange equations), and

sometimes to the solutions to those equations. However, kinematics is simpler.

Kinematics | MATHalino

Kinematics is the description of the motion of material bodies without referring to their inertia or the forces that caused their motion. This chapter introduces the important concept of inertial and non-inertial frames of reference and uses them to illustrate how to fully describe the kinematics of particles.

We will study the dynamics of particle motion and bodies in rigid planar (2D) motion. This will consist of both the kinematics and kinetics of motion. Kinematics deals with the geometrical aspects of motion describing position, velocity, and acceleration, all as a function of time.
