Rails Around the World is a visually glorious history depicting trains and locomotives at work in scenic locations throughout North America, Europe, and Asia.

This book presents in detail the most important driving and engine cycles used for the certification and testing of new vehicles and engines around the world. It covers chassis and engine-dynamometer cycles for passenger cars, light-duty vans, heavy-duty engines, non-road engines and motorcycles, offering detailed historical information and critical review. The book also provides detailed examples from SI and diesel engines and vehicles operating during various cycles, with a focus on how the engine behaves during transients and how this is reflected in emitted pollutants, CO<sub>2</sub> and after-treatment systems operation. It describes the measurement methods for the testing of new vehicles and essential information on the procedure for creating a driving cycle. Lastly, it presents detailed technical specifications on the most important chassis-dynamometer cycles around the world, together with a direct comparison of those cycles.

This CSIS report describes how DoD's investment in military aircraft engines will decrease significantly, presenting a challenge for the industrial base. The report also argues that DoD must make four major policy choices in its investment approach to military engines: priority, resources, business model, and competition.
