Exercises 2.3 Linear Equations 53 (Alternatively, one can notice that the left-hand side of the original equation is the derivative of the product $y \sin x$.)

So, using integration by parts, we obtain $y \sin x =$

$x \sin x dx = -x \cos x + \sin x + C \implies y = -x \cot x + 1 + C \csc x$.

We find C using the initial condition $y(\pi/2) = 2$: $2 = 1 + C$.

differential equations course that is essential to science and engineering students. It reflects the new qualitative approach that is altering the learning of elementary differential equations, including the wide availability of scientific computing environments like Maple, Mathematica, and MATLAB. Its focus balances the traditional manual methods with the new computer-based methods that illuminate qualitative phenomena and make accessible a wider range of more realistic applications. Seldom-used topics have been trimmed and new topics added: it starts and ends with discussions of mathematical modeling of real-world phenomena, evident in figures, examples, problems, and applications throughout the text.

Incorporating an innovative modeling approach, this book for a one-semester differential equations course emphasizes conceptual understanding to help users relate information taught in the classroom to real-world experiences. Certain models reappear throughout the book as running themes to synthesize different concepts from multiple angles, and a dynamical systems focus emphasizes predicting the long-term behavior of these recurring models. Users will discover how to identify and harness the mathematics they will use in their careers, and apply it effectively outside the classroom.
